4. Key Behavioral Observations

1. Fraud Prevalence

48.1% of all transactions are flagged as fraudulent. Fraudulent transactions average **$787.66** compared to **$755.88** for legitimate ones — higher by **4.2%**.

2. Device Behavior

Fraud rates by device: **Desktop**: 44.7%, **Mobile**: 51.2%. Mobile devices show a notably higher fraud incidence.

3. Network Slice Patterns

Fraud rates by network slice: **Slice1**: 44.6%, **Slice2**: 50.9%, **Slice3**: 48.7%. Slice2 exhibits the highest fraud concentration.

4. Transaction Type Risk

Fraud rates by type: **Deposit**: 52.8%, **Transfer**: 45.5%, **Withdrawal**: 46.5%. Deposit transactions carry the highest fraud risk.

5. High-Value Transactions

Transactions above the 90th percentile (>$1,332) show a **49.0%** fraud rate vs **48.0%** for normal-value transactions.

6. Latency & Bandwidth

Average latency — Legit: **11.7ms**, Fraud: **11.7ms**. Average bandwidth — Legit: **149.5 Mbps**, Fraud: **147.4 Mbps**. Neither metric shows significant deviation between fraud and legitimate transactions.

7. Transaction Status

Fraud rates by status: **Failed**: 48.7%, **Success**: 47.4%. Fraud is nearly equally distributed across successful and failed transactions.

Summary

This dataset of **1,000** transactions reveals a **48.1%** fraud rate. Fraudulent transactions tend to have slightly higher amounts. Mobile devices and Deposit-type transactions show elevated fraud risk. Network and latency metrics do not significantly differentiate fraud from legitimate activity, suggesting these are weaker signals for fraud detection in this dataset.
